

Effective weed control for roadside guard rails

Key Features

- Esplanade Herbicide contains Indaziflam, the only Group 29 active registered for use in Vegetation Management in Australia
- Contains 500 g/L indaziflam. Indaziflam is a cellulose biosynthesis inhibitor (CBI)
- As weed seeds germinate, new root growth comes in contact with Esplanade and inhibits further growth
- Safe, reliable, long-term residual annual grass and broadleaf weed control
- Has little effect on existing weeds and requires a tank mix of a registered post emergent herbicide to control any existing vegetation
- A key tool in controlling key weeds such as fleabane, ryegrass, soft brome and capeweed
- Suspension concentrate formulation with a low use rate, 75 grams indaziflam per hectare

Avoid a build-up of fuel loads and visual impact around guard rails

Across Australia, hundreds of thousands of kilometres of road assets require ongoing vegetation management. As highway guard rails have become standard, maintenance approaches have needed to adapt. These essential barriers create hard-to-reach zones where traditional slashing and mowing can't effectively operate. As a result, vegetation around and beneath guard rails is often left unmanaged, highlighting the need for more targeted, efficient control solutions for roadside vegetation managers.

Extended residual control

Apply as a pre-emergent OR combine with a knockdown

Esplanade® Herbicide can be tank-mixed with a registered post-emergent herbicide to control existing vegetation while establishing long-term protection. When used as directed, it delivers pre-emergent control of more than 30 broadleaf weeds, annual grasses, sedges and rushes, with up to 8 months of residual activity. With strong soil adsorption to minimise off-target movement, Esplanade provides a dependable, long-lasting foundation for modern vegetation management programs.

Effective non-mechanical vegetation control

The use of Esplanade Herbicide can extend the time between, and reduce the frequency of, management interventions to keep road assets safe, minimise roadside fuel build-up and lower fire risk.

Target resistant weeds

Esplanade has a unique mode of action which means that it can be effectively used in weed management programs in situations where weeds resistant to other herbicide mode of action groups may exist.
